Bayes rule

Given probabilities p(A), p(B), and the joint probability p(A, B), we can write the conditional probabilities

Will Penny

Bayesian Inference

Bayes rule

Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference Gaussians Sensory Integration Decision Making Dynamics

References

$$p(B|A) = \frac{p(A,B)}{p(A)}$$
$$p(A|B) = \frac{p(A,B)}{p(B)}$$

Eliminating p(A, B) gives Bayes rule

$$p(B|A) = rac{p(A|B)p(B)}{p(A)}$$

Bayes rule

The terms in Bayes rule

$$p(B|A) = rac{p(A|B)p(B)}{p(A)}$$

are referred to as the prior, p(B), the likelihood, p(A|B), and the posterior, p(B|A).

The probability p(A) is a normalisation term and can be found by *marginalisation*. For example,

$$p(A = 1) = \sum_{B} p(A = 1, B)$$

= $p(A = 1, B = 0) + p(A = 1, B = 1)$
= $p(A = 1|B = 0)p(B = 0) + p(A = 1|B = 1)p(B = 1)$

Johnson et al (2001) consider Bayesian inference in for Magnetic Resonance Angiography (MRA). An Aneurysm is a localized, blood-filled balloon-like bulge in the wall of a blood vessel. They commonly occur in arteries at the base of the brain.

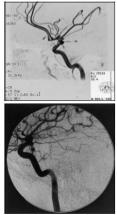

Fig 1 Case 1: magnetic resonance angiography with maximum intensity projection has normal appearance (top), whereas intra-artient alight subtraction angiography (injection of left internal carold artery) shows a large left posterior communicating artery anewysm (betom)

MRA can miss sizable Intracranial Aneurysms (IA)'s but is non-invasive (top).

Intra-Arterial Digital Subtraction Angiography (DSA) (bottom) is the gold standard method for detecting IA but is an *invasive* procedure requiring local injection of a contrast agent via a tube inserted into the relevant artery.

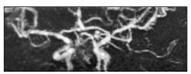

Bayesian Inference

Will Penny

Bayesian Inference

Bayes rule

Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference Gaussians Sensory Integration

Given patient 1's symptoms (oculomotor palsy), the prior probability of IA (prior to MRA) is believed to be 90%.

For IAs bigger than 6mm MRA has a sensitivity and specificity of 95% and 92%.

What then is the probability of IA given a *negative* MRA test result ?

Bayesian Inference

Will Penny

Bayesian Inference

Medical Decision Making Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference Gaussians Sensory Integration Decision Making Dynamics

References

Fig 2 Case 2: magnetic resonance angiography with maximum intensity projection has normal appearance (ton), whereas intra-arterial digital subtraction angiography (injection of right internal carntin artery) shows a large right posterior communicating artery aneurysm (hottom)

The probability of IA given a negative test can be found from Bayes rule

$$p(IA = 1|MRA = 0) = \frac{p(MRA = 0|IA = 1)p(IA = 1)}{p(MRA = 0|IA = 1)p(IA = 1) + p(MRA = 0|IA = 0)p(IA = 0)}$$

where p(IA = 1) is the probability of IA prior to the MRA test. MRA test sensitivity and specificity are

$$p(MRA = 1 | IA = 1)$$
$$p(MRA = 0 | IA = 0)$$

We have p(MRA = 0 | IA = 1) = 1 - p(MRA = 1 | IA = 1)

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○ のへぐ

Joint Probability

A DAG specfies the joint probability of all variables.

 $p(x_1, x_2, x_3, x_4, x_5) = p(x_1)p(x_2)p(x_3|x_1)p(x_4|x_1, x_2)p(x_5|x_4)$

The negative log of the joint probability is known as the Gibbs Energy. All other variables can be gotten from the joint probability via marginalisation.

Did I Leave The Sprinkler On ?

The probability that the sprinkler was on given i've seen the lawn is wet is given by Bayes rule

$$p(s = 1 | w = 1) = \frac{p(w = 1 | s = 1)p(s = 1)}{p(w = 1)}$$
$$= \frac{p(w = 1, s = 1)}{p(w = 1, s = 1) + p(w = 1, s = 0)}$$

where the joint probabilities are obtained from marginalisation

$$p(w = 1, s = 1) = \sum_{r=0}^{1} p(w = 1, r, s = 1)$$
$$p(w = 1, s = 0) = \sum_{r=0}^{1} p(w = 1, r, s = 0)$$

and from the generative model we have

$$p(w,r,s) = p(r)p(s)p(w|r,s)$$

Bayesian Inference

Will Penny

Bayesian Inference

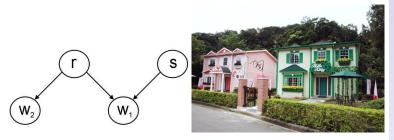

Bayes rule Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Evalation Away

Explaining Away Perception as Inference Gaussians Sensory Integration Decision Making Dynamics

Look next door

Rain *r* will make my lawn wet w_1 and nextdoors w_2 whereas the sprinkler *s* only affects mine.

$$p(w_1, w_2, r, s) = p(r)p(s)p(w_1|r, s)p(w_2|r)$$

Numerical Example

Bayesian models force us to be explicit about exactly what it is we believe.

$$p(r = 1) = 0.01$$

$$p(s = 1) = 0.02$$

$$p(w = 1 | r = 0, s = 0) = 0.001$$

$$p(w = 1 | r = 1, s = 1) = 0.97$$

$$p(w = 1 | r = 1, s = 0) = 0.90$$

$$p(w = 1 | r = 1, s = 1) = 0.99$$

These numbers give

$$p(s = 1 | w = 1) = 0.67$$

 $p(r = 1 | w = 1) = 0.31$

Bayesian Inference

Will Penny

Bayesian Inference

Bayes rule Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away

Gaussians Sensory Integration Decision Making Dynamics

References

・ロト・西・・田・・田・・日・

Explaining Away

Numbers same as before. In addition

$$p(w_2 = 1 | r = 1) = 0.90$$

Now we have

$$p(s = 1 | w_1 = 1, w_2 = 1) = 0.21$$

 $p(r = 1 | w_1 = 1, w_2 = 1) = 0.80$

The fact that my grass is wet has been explained away by the rain (and the observation of my neighbours wet lawn).

Bayesian Inference

Bayes rule Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes **Explaining Away** Perception as Inference Gaussians

Sensory Integration Decision Making Dynamics

Perception as Inference

In Helmholtz's view our percepts are our best guess as to what is in the world, given both sensory data and prior experience. He proposed that perception is unconscious inference.

Bayesian Inference

Will Penny

Bayesian Inference

Bayes rule Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away

Perception as Inference

Gaussians Sensory Integration Decision Making Dynamics

Gaussians

Precision is inverse variance eg. a variance of 0.1 is a precision of 10.

For a Gaussian prior with mean m_0 and precision λ_0 , and a Gaussian likelihood with mean m_D and precision λ_D the posterior is Gaussian with

$$\lambda = \lambda_0 + \lambda_D$$
$$m = \frac{\lambda_0}{\lambda} m_0 + \frac{\lambda_D}{\lambda} m_D$$

So, (1) precisions add and (2) the posterior mean is the sum of the prior and data means, but each weighted by their relative precision.

Bayesian Inference

Will Penny

Bayesian Inference

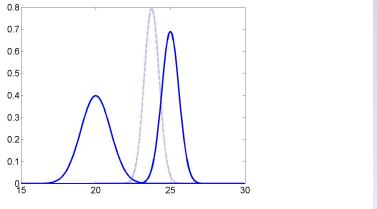

Bayes rule Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference

Gaussians

Sensory Integration Decision Making Dynamics

Gaussians

The two solid curves show the probability densities for the prior $m_0 = 20$, $\lambda_0 = 1$ and the likelihood $m_D = 25$ and $\lambda_D = 3$. The dotted curve shows the posterior distribution with m = 23.75 and $\lambda = 4$. The posterior is closer to the likelihood because the likelihood has higher precision.

Bayesian Inference

Bayes rule Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference

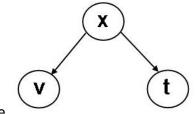

Gaussians

Sensory Integration Decision Making Dynamics

Sensory Integration

Ernst and Banks (2002) asked subjects which of two sequentially presented blocks was the taller. Subjects used either vision alone, touch alone or a combination of the two.

If vision v and touch t information are independent given

an object x then we have

p(v, t, x) = p(v|x)p(t|x)p(x)

Bayesian fusion of sensory information then produces a posterior density

$$p(x|v,t) = \frac{p(v|x)p(t|x)p(x)}{p(v,t)}$$

Bayesian Inference

Will Penny

Bayesian Inference

Bayes rule Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference Gaussians Sensorv Integration

Decision Making Dynamics

Sensory Integration

In the abscence of prior information about block size (ie p(x) is uniform), for Gaussian likelihoods, the posterior will also be a Gaussian with precision λ_{vt} . From Bayes rule for Gaussians we know that precisions add

$$\lambda_{\mathbf{v}t} = \lambda_{\mathbf{v}} + \lambda_t$$

and the posterior mean is a relative-precision weighted combination

$$m_{vt} = \frac{\lambda_v}{\lambda_{vt}}m_v + \frac{\lambda_t}{\lambda_{vt}}m_t$$
$$m_{vt} = w_v m_v + w_t m_t$$

with weights w_v and w_t .

Dynamics

Consider a discrete set of time points t(n) within the trial with n = 1, 2, ..N.

Denote x_n as population vector observed at time t(n) and $X_n = [x_0, x_1, ..., x_n]$ as all vectors observed up until time point t(n).

Yu et al. (2009) formulate a discrete time inferential model. We will consider continuous time models later.

Inference

The following joint probability is updated recursively

$$p(s_2, M|X_n) = \frac{p(x_n|s_2, M)p(s_2, M|X_{n-1})}{\sum_{s'_2, M'} p(x_n|s'_2, M')p(s'_2, M'|X_{n-1})}$$

Then marginalise over *M* to get decision probability

$$p(s_2 = H|X_n) = p(s_2 = H, M = C|X_n) + p(s_2 = H, M = I|X_n)$$

Initialise with

$$p(s_2 = H, M = C | X_0) = p(s_2 = H)p(M = C)$$

$$p(s_2 = H, M = C | X_0) = 0.5\beta$$

$$p(s_2 = H, M = I | X_0) = 0.5(1 - \beta)$$

where $p(M = C) = \beta$.

eferences

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ● ●

Inference

On most trials (18 out of 20) evidence slowly accumulates in favour of the central stimulus being $s_2 = H$. This is reflected in the posterior probability $p(s_2 = H|X_n)$.

This corresponds to evidence for a left button press.

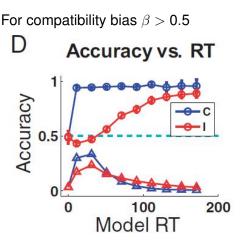

Bayesian Inference

Will Penny

Bayesian Inference

Bayes rule Medical Decision Making Directed Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference Gaussians Sensory Integration Decision Making Dynamics

Compatibility Bias Model

The model also shows the initial dip for incompatible flankers.

Bayesian Inference

Will Penny

Bayesian Inference

Bayes rule Medical Decision Making Directed Aycilic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference Gaussians Sensory Integration Decision Making Dynamics

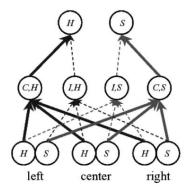

Neural Implementation

The Bayesian inference equations

$$p(s_2, M|X_n) = \frac{p(x_n|s_2, M)p(s_2, M|X_{n-1})}{\sum_{s'_2, M'} p(x_n|s'_2, M')p(s'_2, M'|X_{n-1})}$$

$$p(s_2 = H|X_n) = p(s_2 = H, M = C|X_n) + p(s_2 = H, M = I|X_n)$$

can be implemented as a network model.

The hidden layer representations are *self-exciting* and require *divisive normalisation*. In the compatibility bias model the compatible pathway is initially excited.

Bayesian Inference

Will Penny

Bayesian Inference

Bayes rule Madical Dacision Making Divected Acyclic Graph Joint Probability Marginalisation Multiple Causes Explaining Away Perception as Inference Gaussians Sensory Integration Decision Making Dynamics

Approximate Inference

As the number of stimuli grows exact inference becomes intractable. Instead, we can initially *assume* compatibility.

$$p(s_2 = H|X_t) = \frac{p(x_1(t)|s_1 = H)p(x_2(t)|s_2 = H)p(x_3(t)|s_3 = H)p(s_2 = H|X_{t-1})}{\sum_{s=H,S} p(x_1(t)|s_1 = s)p(x_2(t)|s_2 = s)p(x_3(t)|s_3 = s)p(s_2 = s|X_{t-1})}$$

If the flankers are detected to be incompatible we can then switch to an inferential scheme which ignores them

$$p(s_2 = H|X_t) = p(x_2(t)|s_2 = H)p(s_2 = H|X_{t-1})$$
